

Current view of AP

- Use benefits of finite automata at class graph level to specify traversals as partial programs
- Use visitors to decorate traversals
- Use adjusters to organize traversals and visitors

New forces

- Mitch's traversal automata
- Mendelzon's graph patterns, WebSQL, WebOQL, schema-free data model
- Smaragdakis' suggestions on strategies

Theory of Traversals

- Influence: SIAM J. Comput. paper by Alberto Mendelzon and Peter Wood: Finding Regular Simple Paths in Graph Databases, 24:6 pages 1235-1258, 1995
– Conference version: VLDB 1989

History

- Relational model: simple for users and mathematicians. Query languages (relational calculus and relational algebra) not expressive enough (transitive closure of a binary relation not expressible).
- More expressive query languages: Datalog (Ullman) and G+ (Cruz, Mendelzon, Wood)

G+

- based on graph traversals
 - Database is a directed labeled graph (corresponding to an object graph in our model)
 - Queries are graph patterns expressed using regular expressions: A graph pattern is a labeled graph:
 - node labels are constants to be matched with db
 - edges are labeled with regular expressions(corresponding to our strategies)

4/2/98

Graph Patterns/AOOS

5

Example: Pattern Graph

- Is there a way to go from Section 3.1 to section 5.2 and then to the conclusion without reading any node more than once? (focus on *simple* paths). G = hypertext document. Pattern Graph:

4/2/98

Graph Patterns/AOOS

6

Abstract problem

- **REGULAR SIMPLE PATH:**
 - Instance: Regular expression R and graph G.
 - Question: Is there a directed simple path p in G satisfying R, where the concatenation of edge labels comprising p is in the language denoted by R.
- **Surprise: REGULAR SIMPLE PATH is NP-complete**

4/2/98

Graph Patterns/AOOS

7

Abstract problem:

- **FIXED REGULAR SIMPLE PATH (R):**
 - Instance: Regular expression R and graph G.
 - Question: Is there a directed *simple* path p in G satisfying R, where the concatenation of edge labels comprising p is in the language denoted by R.
- **Surprise: FIXED REGULAR SIMPLE PATH(R) is NP-complete for $R = (00)^*$**

4/2/98

Graph Patterns/AOOS

8

Related problem

- **PATH VIA NODE**
 - Instance: Directed graph $G=(N,E)$, and nodes x,y,m in N .
 - Question: Is there a directed simple path from x to y via m ?
- **PATH VIA NODE is NP-complete**

4/2/98

Graph Patterns/AOOS

9

Abstract problem

- **REGULAR PATH:**
 - Instance: Regular expression R and graph G .
 - Question: Is there a directed path p in G satisfying R , where the concatenation of edge labels comprising p is in the language denoted by R .
- **REGULAR PATH is in P.**

4/2/98

Graph Patterns/AOOS

10

Proof 1

- Given graph G along with nodes x and y in G , we can view G as an NFA with initial state x and final state y . Construct the intersection graph I of G and an NFA M accepting $L(R)$. There is a path from x to y satisfying R if there is a path in I from (x, s_0) to (y, sf) , for s_0 the start state of M and some final state sf in M .

4/2/98

Graph Patterns/AOOS

11

Proof 1

- All this can be done in polynomial time by Hunt, Rosenkrantz and Szymanski, 1976.

4/2/98

Graph Patterns/AOOS

12

Proof 2, using Tarjan 1981

- Tarjan provides a polynomial algorithm for constructing a regular expression R_{xy} which represents the set of all paths between two nodes x and y of a given graph.
- Is there a path between x and y satisfying R :
 - construct R_{xy}
 - determine whether intersection of $L(R)$ and $L(R_{xy})$ is nonempty using NDFAs.

4/2/98

Graph Patterns/AOOS

13

Connections, Implications

- Toronto approach has only graph patterns (similar to strategies) and database graphs (similar to object graphs). No knowledge about structure of database graphs; i.e., no schema = class graph. Well, they use cycle constraints.
- Toronto paper contains useful facts to better understand traversals and their limitations.

4/2/98

Graph Patterns/AOOS

14

Structure-shyness in Toronto approach

- pattern graph gives topology of navigation
- `_*` (underscore matches any edge label)

Pattern graph

Strategy graph

4/2/98

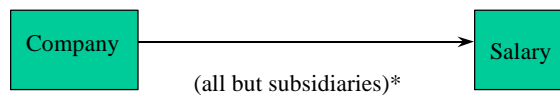

Graph Patterns/AOOS

15

Structure-shyness in Toronto approach

- Bypassing

Pattern graph

Strategy graph

4/2/98

Graph Patterns/AOOS

16

Structure-shyness in Toronto approach

- Toronto approach uses regular expressions
 - positive and negative
 - may be confusing: pattern graph positive
- Strategy graphs use constraint maps
 - negative: what we want to avoid.
 - leave it open how to specify maps
 - could use regular expressions to specify constraint map

4/2/98

Graph Patterns/AOOS

17

Toronto approach

- Shows how to deal with structure-shyness without schema = class graph.
- Proposes uniform automata-based approach to AP also suggested by Yannis Smaragdakis
 - all graphs correspond to finite automata: class, strategy, traversal and object graphs
 - Algorithm 1: intersection of two automata.
 - Algorithm 2: intersection of traversal graph and object graph.

4/2/98

Graph Patterns/AOOS

18

What is still new in strategies

- uses schema = class graph = constraints on object graphs. Provides compilation algorithm. Deals with abstract classes and subclass edges. Three level model.
- Model has same expressiveness as graph patterns.
 - Can specify constraint maps using regular expressions: eliminate edges not contained in any path defined by regular expression

4/2/98

Graph Patterns/AOOS

19

What is role of graph in graph patterns?

- $(A _+ B _+ C _+)^*$ not correct
- $A (_+ B _+ C _+ A)^*$
- put node names also in paths

4/2/98

Graph Patterns/AOOS

20

Regular expressions only

- Can we express any graph pattern or strategy graph as a regular expression?

4/2/98

Graph Patterns/AOOS

21

John Lamping's proposal

operator	regular expression	
[A,B]	A.any*.B	Strategies are shorter
through lnk	any*.lnk.any*	
bypassing lnk	not(any*.lnk.any*)	
through C	any*.C.any*	
bypassing C	not(any*.C.any*)	
d1 join d2	[d1].[d2] // join point twice!	
d1merge d2	[d1]\cup[d2]	
not d1	not([d1])	
only-through A,b,B	A.b.B	

4/2/98

Graph Patterns/AOOS

22

The following to be improved

- Traversal automata for strategy graphs

4/2/98

Graph Patterns/AOOS

23

Ordering of edges in strategies

A q0
traverse to B q1
traverse to C q2
traverse to B q3
A q4
traverse e1 q5

actions before [A,B] and before [A,C], for example

- + A₋+ B
- + A₋+ C
- + A₋+ B

4/2/98

Graph Patterns/AOOS

24

Regular expressions

- define path sets
- but we want to define traversals with specific orderings of path sets

4/2/98

Graph Patterns/AOOS

25

Traversal automata

- Allow us to control ordering and sequencing of traversals (and when to call visit operations)
- Control can be based on
 - edges in class graph
 - edges in strategy graph (new refinement)

4/2/98

Graph Patterns/AOOS

26

Traversal Automata

```
ClassValuedVar1 State1
  traverse relationValuedVar1 State2
  traverse to ClassValuedVar2 State3 following constraint1
  traverse to ClassValuedVar3 State4 following constraint2
```

When a class graph is given, the traversal automaton is expanded into:

```
Class1 State1
  traverse relation1 State2
  traverse relation2 State1 // at target switch to State3
  traverse relation3 State1 // at target switch to State4
```

Better view

- So far, traversal automata were defined in terms of class graphs.
- Now we define them in terms of strategy graphs: Need to give names to edges. Edge names are abbreviations of constraints associated with edge.

New kind of strategy graph: looks like a class graph

b1=bypassing ->*,x,*
b2=only-through ->A,b,B
c1=no restriction

A,B,C: class valued variables
x,b: relation-valued variables

4/2/98

Graph Patterns/AOOS

29

Strategic Traversal Automata

```
A State1 traverse b1 State2
  traverse b2 State3
  traverse c1 State4
  traverse b1 State5
B State2 traverse d1 State5
  State5 //nothing
```

When a class graph is given, the strategic traversal automaton is expanded into a traversal automaton for the class graph.

Benefits: can use standard traversal automata, promotes parts-free programming.

4/2/98

Graph Patterns/AOOS

30

New role of strategies

- Define blueprint for traversal automata.
- Strategic traversal automaton defines a few default traversal automata:
 - DFS, class graph order (what we use now)
 - DFS, strategy graph order
 - BFS, class graph order
 - BFS, strategy graph order

4/2/98

Graph Patterns/AOOS

31

What is new?

- Traversal automata are expressed in terms of class-valued and relation-valued variables.
- Detailed traversals are expressed at higher level: at strategy graph level
- Strategy graphs now have the structure of class graphs with concrete classes only and all parts required.

4/2/98

Graph Patterns/AOOS

32

Expansion

- Given a class graph, translate a strategic traversal automaton to a traversal automaton
 - write traversal graph as traversal automaton and expand it following information in strategic traversal automaton.
 - reorder traversals
 - add more traversals

4/2/98

Graph Patterns/AOOS

33

Evolution

- Graphs (object graphs), need to traverse, know about their structure (class graph), formulate traversals at class graph level using PL. Has flavor of traversal automata.
Implementation:
 - state-less: leads to exponential size code
 - with state: becomes efficient

4/2/98

Graph Patterns/AOOS

34

Evolution (continued)

- Instead of using PL, use strategies: abstraction of class graph using regular expressions over class graph. We lose some of the flexibility of the traversal automata solution: strategies define only certain default traversals.
- Solution: use strategic traversal automata to gain flexibility.

4/2/98

Graph Patterns/AOOS

35

Intersection of NDFA is similar to traversal graph construction

Intersection of two DFAs

4/2/98

Graph Patterns/AOOS

36

Traversal Graph Construction

4/2/98

Graph Patterns/AOOS

37

Integrated view of algorithms 1 and 2: for path existence

- Both are similar to the intersection of two NDFAs
 - Algorithm 1: NFA for strategy graph and NFA for class graph: results in NFA for traversal graph.
 - Algorithm 2: NFA for traversal graph and NFA for object graph: results in NFA which tells us whether there is a non-empty traversal

4/2/98

Graph Patterns/AOOS

38

Recall: Intersection of NDFAs

- An NFA is a 5-tuple: $M=(S,A,d,p_0,F)$, S finite set of states, A is input alphabet, d is a state transition function which maps $A \times (S \cup \epsilon)$ to the set of subsets of S , p_0 is the initial state, and F is the set of final states.

Recall: Intersection of NDFAs

- $M_1=(S_1,A,d_1,p_0,F_1)$ and $M_2=(S_2,A,d_2,q_0,F_2)$.
- The NFA for M_1 intersect M_2 is $I=(S_1 \times S_2,A,d,(p_0,q_0),F_1 \times F_2)$, where for a in A , (p_2,q_2) in $d((p_1,q_1),a)$ if and only if p_2 in $d_1(p_1,a)$ and q_2 in $d_2(q_1,a)$.

Graph Layers

graph layers G_1, G_2, \dots, G_n
 G_i is an abstraction of G_{i+1}
Can embed G_i in G_{i+1}
Paths in G_i exist in G_{i+1} in expanded form
 G_i determines traversals in G_{i+1}
Hierarchy of graph refinements

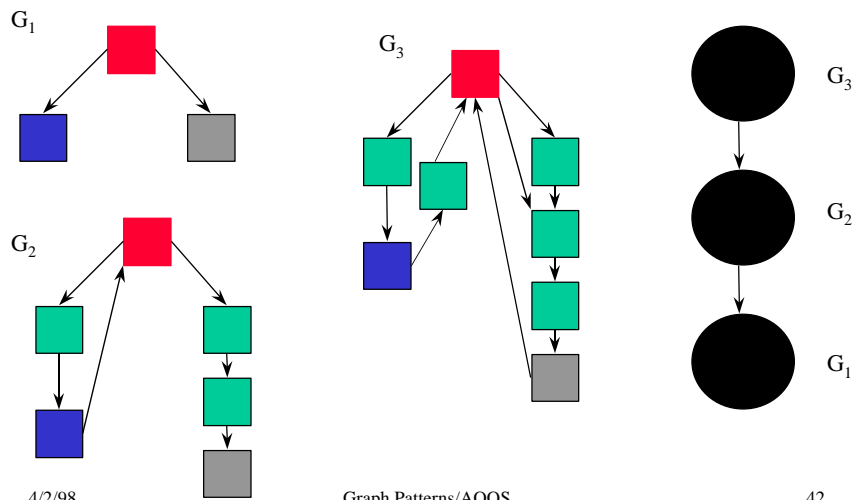

Use traversal automaton if necessary

4/2/98

Graph Patterns/AOOS

41

Hierarchy

Current way of AP

4/2/98

Graph Patterns/AOOS

43

Better way of AP

s6, s7 shield s1 through s5 from changes to G

4/2/98

Graph Patterns/AOOS

44

Hierarchical development of strategies

4/2/98

Graph Patterns/AOOS

45

Layered strategies

- strategies of the form $(\rightarrow A \{B, C, D\}$ bypassing ...) reduce the graph size and result is still a graph.
- Should strategies at inner nodes be of this form?

4/2/98

Graph Patterns/AOOS

46

“New” view of strategy graphs

- So far we mapped strategy graphs into class graphs.
- Why not map them into object graphs?
- The purpose of strategy graphs is to express algorithms in a structure-shy way.
- In some cases better achieved by mapping strategies into object graphs.

4/2/98

Graph Patterns/AOOS

47

Some surprises along the way

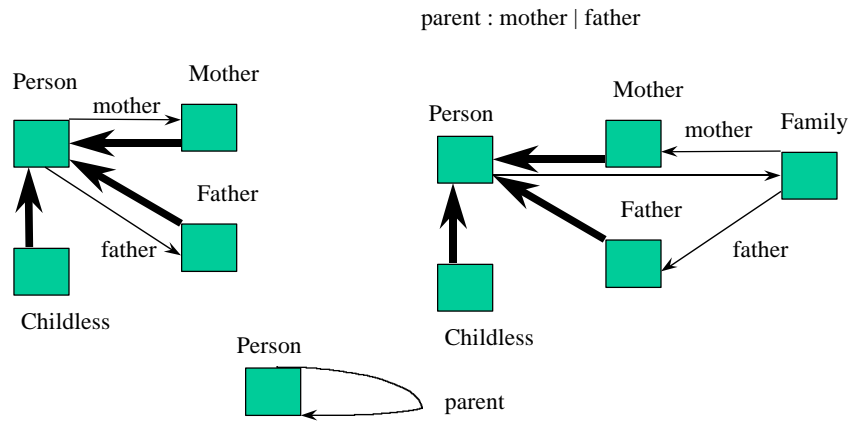

- Extend strategies with regular expressions on edges
- Express that certain paths are not allowed to exist

4/2/98

Graph Patterns/AOOS

48

Nearest Common Ancestor

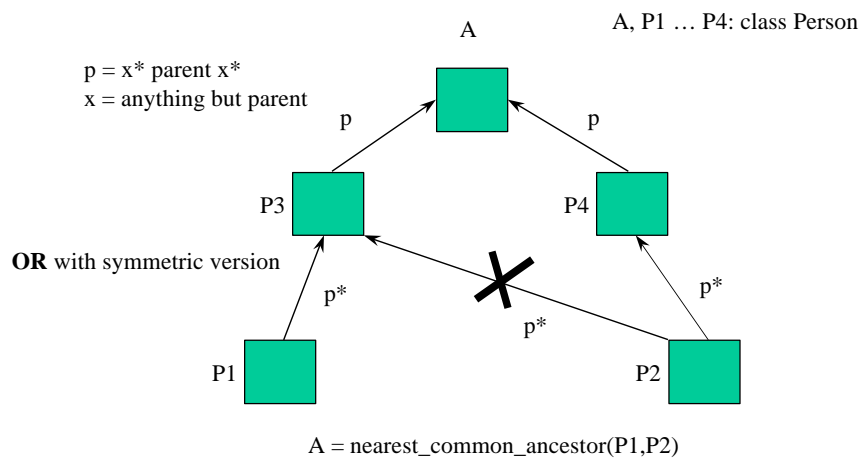

4/2/98

Graph Patterns/AOOS

49

Strategy graph

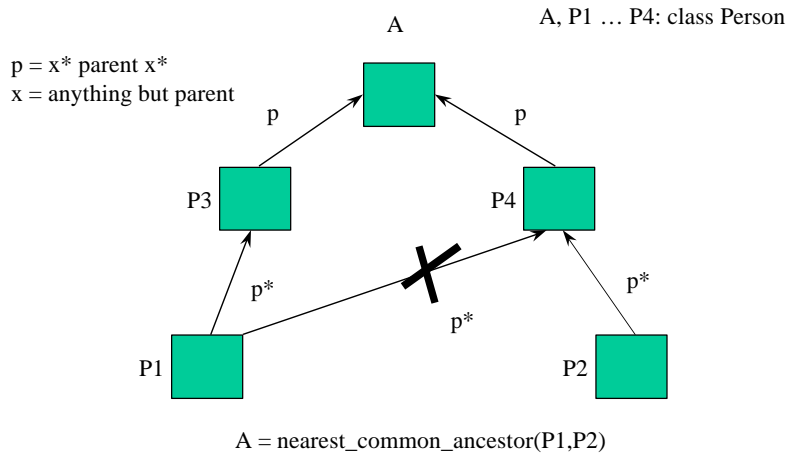

4/2/98

Graph Patterns/AOOS

50

Strategy graph: symmetric

4/2/98

Graph Patterns/AOOS

51

Strategy graphs have changed

- Constraints are regular expressions
- Nodes are mapped to objects
- Also express relationships which are not allowed to exist

4/2/98

Graph Patterns/AOOS

52

Implementation

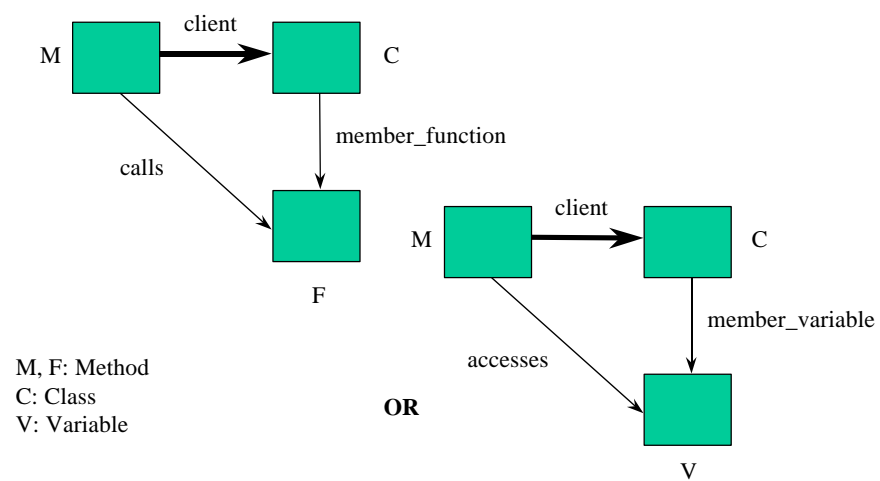

- Pattern matching for graphs
- When pattern matches, execute code.
Pattern matching visitor
- Need to do search for desired pattern

58

Other example of negation

4/2/98

Graph Patterns/AOOS

59

GraphLog

- Visual query language for the Hy+ visualization system
 - M. Consens, Master Thesis, 1989, Ph.D. 1995
 - M.Consens, A. Mendelzon: SIGMOD '90
- Query processing: translate queries and data into logic programs for execution by
 - LDL
 - CORAL

4/2/98

Graph Patterns/AOOS

60

GraphLog

- Many databases can be naturally viewed as graphs.
- Even a relational db: can be represented by a directed multigraph having an edge labeled $r(c_1, \dots, c_k)$ from a node labeled (a_1, \dots, a_i) to a node labeled (b_1, \dots, b_j) corresponding to each tuple $(a_1, \dots, a_i, b_1, \dots, b_j, c_1, \dots, c_k)$ of relation r .

4/2/98

Graph Patterns/AOOS

61

small case: constant (disk1)
upper case: variable (D)

Recursive query with negation

```
tc-contains(D,F) <- contains(D,F).  
tc-contains(D,F) <- tc-contains(D,E),  
contains(E,F).  
disk-util-excl-disk1(D,SUM(S)) <-  
tc-contains(D,F), size(F,S), not  
resides-on(F,disk1).
```

Graph Patterns/AOOS

62

Logic Programs

- p, q predicate symbols
- atom: $p(X_1, \dots, X_n)$ or $X=Y$
- literal: positive or negative atom
- Horn clauses $P \leftarrow A, B, C$

4/2/98

Graph Patterns/AOOS

63

Complexity

- queries expressible in GraphLog are exactly those which are evaluable in non-deterministic logarithmic space in the size of the database.

4/2/98

Graph Patterns/AOOS

64

Differences: Graph Patterns/ Strategies

- straight-line strategies are easily expressible as graph patterns
- but cyclic strategies are not expressible as graph patterns. If a graph pattern is cyclic, then also the matching objects must be cyclic.

Differences: Graph Patterns/ Strategies

- On the other hand: cyclic graph patterns are not expressible as strategy graphs
- But cyclic graph patterns have problems with path summarization

4/2/98

Graph Patterns/AOOS

67

Duplication

- Graph patterns duplicate information

4/2/98

Express graph patterns as adaptive programs

- Not a general translation?

4/2/98

Graph Patterns/AOOS

72

small case: constant (disk1)
 upper case: variable (D)

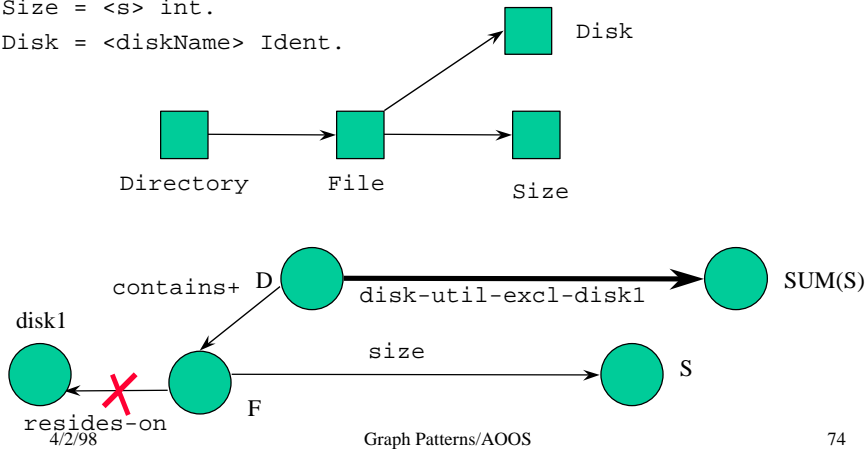

Recursive query with negation

```
tc-contains(D,F) <- contains(D,F).
tc-contains(D,F) <- tc-contains(D,E),
  contains(E,F).
disk-util-excl-disk1(D,SUM(S)) <-
  tc-contains(D,F), size(F,S), not
  resides-on(F,disk1).
```

With AP

```
Directory = <contains> List(Directory) <files> List(File).
File = <residesOn> Disk <size> Size.
Size = <s> int.
Disk = <diskName> Ident.
```

With AP

```
Directory = <contains> List(Directory) <files> List(File).  
File = <residesOn> Disk <size> Size.  
Size = <s> int.  
Disk = <diskName> Ident.
```

```
Directory {  
  int disk_util_excl_disk1() to {Disk,Size} {  
    int total; Ident dn;  
    init (@ total = 0; @)  
    before Disk (@ dn = diskName)  
    before Size (@ if !(dn.equal("disk1")) total += s;  
    return (@ total @)  
  }  
}
```

4/2/98}

Graph Patterns/AOOS

75

My current view

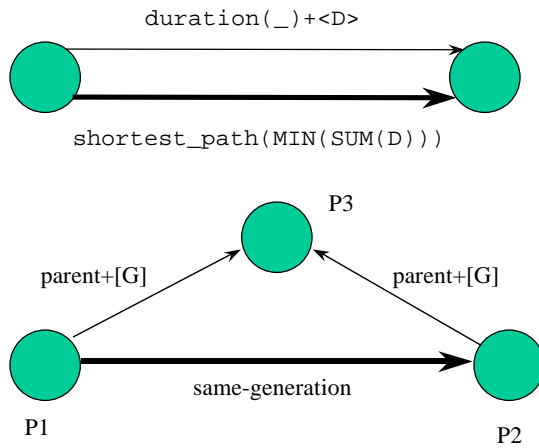

- Graph patterns work well for certain special cases. They have similar structure-shy properties as adaptive programs.
- But AP is more general and works in all cases.
- Graph patterns do not have enough benefits to warrant a special syntax?

4/2/98

Graph Patterns/AOOS

76

Variants of Graph Patterns

4/2/98

Graph Patterns/AOOS

77

Questions

- What is the complexity of strategy equivalence? substrategy checking?

– some algebraic identities:

$$D1*(D2+D3)=D1*D2+D1*D3$$

4/2/98

Graph Patterns/AOOS

78

Questions

- What is the complexity of traversal equivalence? subtraversal checking?
 - Relevant result: Determining whether a regular expression over $\{0\}$ does not denote 0^* is NP-complete. Hence, inequivalence of regular expressions is NP-hard. (see Mendelzon)

4/2/98

Graph Patterns/AOOS

79

Need for intersection

- $A=B.B=C.C=.$ & $A=X.X=Y.Y=C.$
- $A=X.X=B.B=Y.Y=C.C=.$ or $A=X.X=Y.Y=B.B=C.C=.$ etc. would be much longer

4/2/98

Graph Patterns/AOOS

80

Composition of adaptive programs

- Two strategy graphs
 - $A=B.B=C.C=.$
 - $A=X.X=Y.Y=C.$
- Want to do both traversals in one:
 - $A=B.B=C.C=.$ & $A=X.X=Y.Y=C.$
 - class graph: $A=B.B=X.X=Y.Y=C.C=.$ yes
 - class graph: $A=B X.B=C.C=.X=Y.Y=C.$ no

4/2/98

Graph Patterns/AOOS

81

Succinct specification of path sets in graphs

- strategy graph*
- traversal automaton
- strategic traversal automaton*
- graph pattern*
- regular expression with any*
- regular expression

*: not self-contained; needs class graph

4/2/98

Graph Patterns/AOOS

82

Regular expressions of two kinds

- Self-contained
- with respect to a graph $A \rightarrow^* B$ means: take any edge in the graph from A to B. This is more constrained than an ordinary regular expression.
 - Can be extended into a self-contained regular expression where details of graph are encoded

4/2/98

Graph Patterns/AOOS

83

Succinct specification of path sets for families of graphs

- strategy graph
- strategic traversal automaton
- graph pattern
 - regular expressions are using any*: any edge
 - “any” is modulo a graph

4/2/98

Graph Patterns/AOOS

84

Slogan of Adaptive Programming

- Apply automata theory at software architecture-level to control navigation through software architectures.
- Why is automata theory good for structure-shyness? Regular expressions allow “wildcards:
 - engine (subpart)* name
 - engine _* name
